

Geoflex Systems are designed to a "Multi-flex" manufacturing process, allowing for ganging of systems to exactly match any size application that would be required!

Geoflex systems are designed to maximize the energy efficiency in your home, office or commercial space. Geoflex systems are designed to take advantage of every energy atom of process energy to your benefit, reducing your overall energy bill. Instead of throwing away the heat, Geoflex system uses it wherever possible to make hot water, heat your pool, whatever. That's why it's designed to operate at temperatures low enough to make ice. Thermal ice storage allows you to air condition tomorrow by heating or making hot water for your morning shower overnight, when many electrical utilities charge less for energy.

Geoflex manufactures, virtually any capacity systems for residential, commercial and industrial applications. Units are designed to be ganged, offering the smallest to largest systems available on the market today with consideration to efficiency, functionality, service and field adaption opportunities. We also manufacture several sizes of air handlers designed to operate efficiently at the temperatures produced by geothermal systems.

System redundancy is provided by using two or more small heat pumps rather than one large heat pump. Several compressor sections can be connected to a header system to provide the capacity needed for your project.

The Passive Cooling option is designed to allow for cooling of a space without turning the compressor while the closed loop or open well is at the appropriate temperatures.

On-board diagnostics offer diagnostics capabilities from anywhere that has a phone line.

Manufacturers of...

Geothermal Heat Pumps

Water to Water

Water to Air

Air to Water

Water to Air/Water (Quads)

Dehumidification Systems

Chillers

Ice Making Heat Pumps

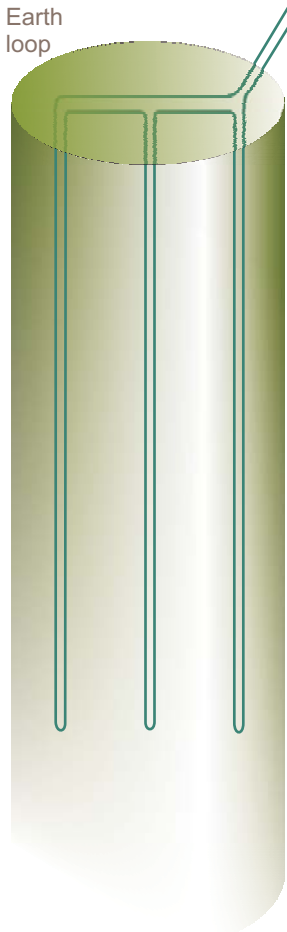

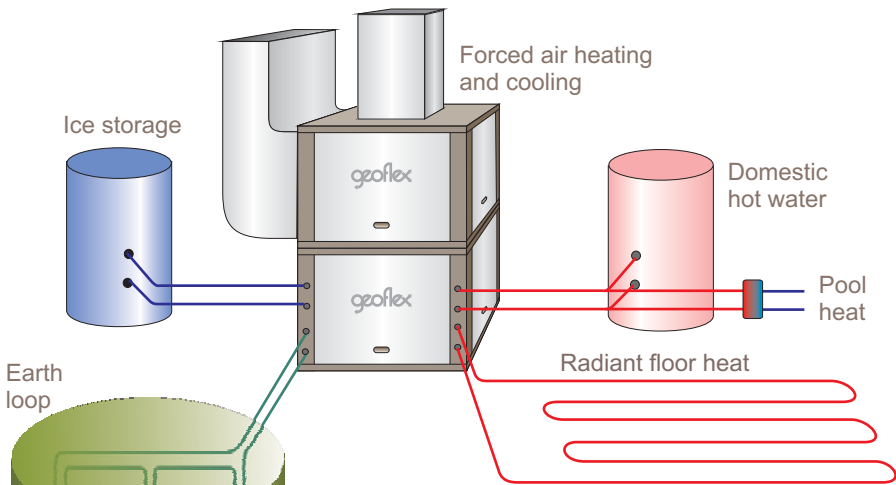

Passive Cooling Systems

Specialty Air Handlers

2 and 4 pipe

**Specialty Replacement,
made to order heat pumps**

**plus many other
Energy Transfer Systems.**

Forced air heating and cooling

Radiant floor heating and cooling

Swimming pool heat

Many other energy transfer opportunities

Ice storage that allows you to air condition your home with “time of use rates” many utilities are quickly moving toward.

Geoflex takes the heat from your home or the ice storage and transfers it to where it’s needed, doubling system efficiency by using both the heat and the cold simultaneously.

When the earth loop is cool enough in spring (as it commonly is in the northern U.S. and Canada), your home is cooled by pumping the cool fluid through the system, tripling and quadrupling the system efficiency.

the configurable system!
